IceSlider is available as a separate module and is not part of the template. You should install it as a module through the J! Administrator. You can find the module inside the Template Package

### Description

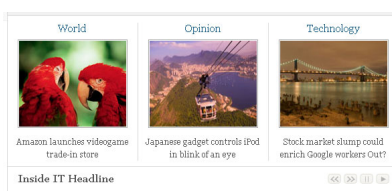

Oone of our most popular and successful modules is IceSlier. It is build in three sliding options: TabularSlide, CarouselSlide, ImageSlide. You can easily change than using by changing the Sliding Layout on the Module Parameter through the J! Administrator. As you can see from the screenshot of the Module Parameter below there are several options that you can change for this module. You can change the transition effect (for this module this parameter is very noticeable), the transmittion time. Also you can enable or disable the Autoplay feature (when is set to yes the slider will begin automatically). For CarouselSlide and Tabularslide there is another interesting feature, the MouseOver Behavior. It means that the user can change the slide with mouseover or with mouseclik.

The IceSlider module as all our modules require that it should have a Category assigned to it. As you can see below from the screenshot the category that is assigned, is the IceSlider category. So the IceSlider module will display all the articles that are under the IceSlider category. Also you can limit the articles that you want to display using the Numbers of Items feature on the Module Parameter

If you need help with this module please take the time to write on our [Forum](#) on the IceTheme website
